

Alpha Reimagined – the Banking Workplace of the Future

What will the future workplace of a bank employee look like when AI and UX are reimagined – and what remains static, what becomes dynamic?

YOUR CHALLENGE

Based on the current Finnova Alpha (Figma template), design your vision of the banking workplace of the future – as a clickable design prototype showing how AI changes daily work.

CONTEXT

Today, Finnova Alpha is the central workplace for bank employees. The interface is functional but largely static: the same screens, navigation and information density – regardless of task, context or person.

AI opens up new possibilities: interfaces that adapt to the task, assistants that think along, and information that appears at the right time. The question is not whether AI will change the workplace – but how you integrate it meaningfully, clearly and trustworthily.

USER QUESTIONS

- What do I see first when I start my working day?
- Which information do I need for this specific task – and which do I not?
- Where does AI actively support me (suggestions, summaries, next steps)?
- When do I want classic screens and full control – and when an assistant?
- How can I tell what is AI-generated and what is authoritative data?
- How does the workplace remain efficient for power users and accessible to newcomers?

DESIGN PRINCIPLE

Not: “AI as an additional window.”

Instead: “AI as part of the workflow – where it really helps.”

YOUR DESIGN DIMENSIONS

Static vs. Dynamic What is fixed structure, and what adapts to context, role and task?

Proactive vs. Reactive Where does the system make suggestions, and where does it wait for input?

Assistance vs. Automation What does AI do itself, and what remains with the human?

Trust & Transparency How are AI-generated contents labelled and made traceable?

POSSIBLE MVP COMPONENTS

- Reimagined home screen / “My Day”
- Contextual customer view (360°, task-specific)
- AI assistant in the workflow (summary, next steps)
- Clearly show dynamic vs. static UI zones
- One complete end-to-end user journey (e.g. preparing a customer meeting)
- Before/after comparison with today’s Alpha

WHY HACK?

- You redesign the workplace of thousands of bank employees – based on a real product.
- You work with the real Finnova Alpha in Figma – not a fictional scenario.
- You explore one of the most exciting UX questions of our time: How does AI change interfaces?
- Your ideas can directly shape the product vision.

GUIDING QUESTION

How can we enable a bank employee to complete a task faster, more safely and with fewer clicks – while always understanding what AI is doing for them?

NORTH STAR

Time to Task Done

WHAT WE WANT TO SEE AT THE END

No complete redesign of every screen. Use a clickable design prototype and concrete user journeys to show what your Alpha of the future looks like: what remains static, what becomes dynamic, and how AI noticeably improves daily work.

Do not pack as much AI as possible into the UI – make as much work as possible noticeably easier.

Basis: Finnova Alpha – current version as a Figma template
