

Kids Banking – the First Bank on Your Wrist

What does a banking experience for children look like on a smartwatch – safe, easy to understand and with genuine learning value?

YOUR CHALLENGE

Develop a prototype of a Kids Banking app for the smartwatch – built on (assumed) Finnova APIs such as customer data, transactions and authentication. Show which APIs you use and how.

CONTEXT

Children are growing up with digital devices – cash is increasingly disappearing from their daily lives. Pocket money, saving and handling money need to be learned in new ways. For many children, the smartwatch is their first personal device: always with them, no smartphone required, accepted by parents.

At the same time, requirements are high: child-friendly language, data protection, parental control and an extremely reduced interface (small screen, short attention span).

We will not provide real APIs – you show which Finnova APIs (e.g. Client Data, Transactions, Payments, Authentication) your solution needs and how they work together.

USER QUESTIONS

- How much pocket money do I have left – and can I understand it at a glance?
- How do I save for a goal (bike, game, trip)?
- How do I pay safely – and what am I (not) allowed to do?
- How can parents see what is happening – without total surveillance?
- How can I learn to handle money through play?
- What happens if the watch is lost?

DESIGN PRINCIPLE

Not: “A scaled-down banking app.”

Instead: “A money companion designed for children – made for the wrist.”

THE ECOSYSTEM

Child (Smartwatch) view, save, pay, learn

Parents (Companion) limits, approvals, pocket money, transparency

Bank (Finnova-APIs) Client Data, Accounts, Transactions, Payments, Authentication

Security child-friendly authentication, limits, fraud protection

POSSIBLE MVP COMPONENTS

- Watch home screen: child-friendly account balance visualisation
- Savings goals with progress and rewards
- Payments with limits and parental approval
- Automatic pocket money and chore rewards
- Parent view (companion app sketch)
- API map: which Finnova APIs are used for what
- Optional: gamification / financial learning modules

WHY HACK?

- You design a product from scratch – maximum creative freedom.
- You design for the most demanding target group: children – and their parents.
- You think API-first: this is how new banking experiences are created on a platform.
- Financial literacy is a societal topic with real impact.

GUIDING QUESTION

How can we enable a child to understand within seconds how much money they have and what they can do with it – while parents trust the solution?

NORTH STAR

Financial Literacy from the Wrist

WHAT WE WANT TO SEE AT THE END

Not a finished product. Use a clickable prototype (watch + parent view) and concrete user journeys to show how Kids Banking works on a smartwatch – including a clear view of which Finnova APIs you assume and how you use them.

Do not shrink banking – make learning about money bigger.

Basis: Assumed Finnova APIs (Client Data, Transactions, Payments, Authentication)
