

Agentic Next best Action (NBA) Studio

Unbounded NBAs. Continuous Growth.

How can we leverage LLMs, ML and foundation models to enable a virtually unlimited number of highly targeted, personalized and fully customizable Next Best Actions — directly at the fingertips of central sales teams and Client Advisors?

YOUR CHALLENGE

Using 200,000+ synthetic client records — including transactions, personal data, existing relationships, accounts, products, meeting notes and proprietary Contovista transaction intelligence — build a dynamic marketplace where NBAs are intelligently generated based on the full available client and bank context.

NBAs should not only be editable, but also generated on the fly using natural language as the primary interface.

The marketplace should continuously adapt. Users can create or refine NBAs through natural-language, while feedback, usage signals —e.g. silencing an inaccurate NBA — continuously improve the system.

The Agentic NBA Studio should also track campaign outcomes and outreach signals, creating a real-time, self-improving feedback loop.

CONTEXT

NBA development today is **slow, static and one-off**. It considers only part of the available client context and often relies on analytics or data science teams building highly specific NBAs for individual campaigns or outreach needs.

As a result, only a fraction of the addressable client base can be reached, often at the wrong time. NBAs are also difficult to adapt based on changing client behaviour, campaign results or conversions — meaning new use cases frequently start from scratch.

USER QUESTIONS

The primary users are **central sales teams and Client Advisors**. Typical questions include:

- Which NBAs best address my current sales objective?
- Which clients should I target for a specific campaign?
- Can I create or adapt an NBA on the fly?
- Can I create a predictive NBA on the fly e.g. *“Find business clients likely to default within the next three months.”*
- Can all relevant client and bank context be considered automatically?
- Can campaign outcomes and feedback improve future recommendations?

THE PIPELINE

Ingest: Load the 200k+ synthetic client dataset.

Prepare: Enrich and adapt the data as required.

Model: Orchestrate NBA creation, understand intent, generate predictive NBAs and incorporate feedback.

Explain: Make every NBA transparent and understandable.

Serve: Demonstrate the Studio through a minimal UI.

Learn: Use feedback, usage and campaign outcomes to continuously improve.

POSSIBLE FUNCTIONALITIES

- **NBA Library:** Discover existing NBAs.
- **NBA Editing:** Adapt existing NBAs through natural language.
- **NBA Generation:** Create new NBAs on the fly.
- **Predictive NBAs:** Dynamically trigger ML/statistical models.
- **Natural-Language UI:** Create and refine NBAs conversationally.
- **Self-Improvement:** Learn from feedback, usage and campaign outcomes.

WHY HACK?

- Work with a large, realistic synthetic banking dataset.
- Build the full stack: model, back-end and front-end.
- Explore agentic AI for one of banking's most relevant use cases: leads and NBAs.
- Combine LLMs, tools and predictive models in a self-improving system.

CHALLENGE QUESTION

How can we put virtually unlimited, personalized NBAs at the fingertips of central sales teams and Client Advisors — generated on the fly for any client need or opportunity?
