

My Goal, My Plan – *Financial Stability Layer*

How can account activity, income and personal life goals be transformed into a clear assessment of whether a financial goal is realistic—together with concrete next steps to achieve it?

YOUR CHALLENGE

Using synthetic data, build a solution that shows banking clients whether life goals—such as buying a home, starting a family, retiring comfortably or travelling the world—are achievable based on their current financial situation.

If a goal is not currently realistic, the solution should quantify the gap, explain the main drivers and recommend practical actions or alternative scenarios that can move the client closer to the goal.

The outcome must be understandable to people without financial expertise and should support informed decisions rather than merely present another score or forecast.

CONTEXT

Many people do not know how much they need to save for a home, a family, retirement or another major life goal. They rarely receive advice that truly reflects their personal situation.

Today's digital banking apps mainly explain what has already happened. They provide limited guidance on whether current income, spending, saving and investing behaviour will be sufficient for future goals.

The challenge is therefore not only to calculate a funding gap, but to communicate it clearly, transparently and credibly and to turn insight into action. A number that clients neither understand nor trust does not provide meaningful guidance.

USER QUESTIONS

- How realistic is my goal given my current saving, investing and spending behaviour?
- If it is not realistic, how large is the gap and when does it become critical?
- What would need to change for me to achieve my goal?
- How would one decision—such as buying a home earlier or early retirement—affect my other financial goals?

THE PROBLEM

- Pension, investment and mortgage decisions are increasingly shifting to independent advisers and robo-advisors including public AIs
- Personal financial advice does not scale and remains largely reserved for affluent clients.
- Cross-selling and up-selling remain reactive because banks lack structured triggers that connect life goals with emerging product needs.
- Limited differentiation from neobanks increases the risk of client attrition.

YOUR SOLUTION SPACE

How you turn account data into a clear answer is intentionally open. You may focus on one life goal or model several interconnected goals. You may use a transparent calculation model, machine learning or a combination of approaches.

What matters is that a person without financial expertise can understand within less than one minute:

- Where do I stand today?
- How realistic is my goal?
- Which options could help me achieve it?

WHY HACK?

- Build an end-to-end experience—from account data to an understandable and actionable recommendation.
- Solve a question almost everyone recognizes: “Will my money be enough for what matters to me?”
- Explore how AI can make personalized financial guidance scalable, explainable and relevant.

GUIDING QUESTION

How can a bank help clients understand within moments whether a life goal is financially realistic—and which practical options could still make it achievable?
